

USSCOS Build Status and Priorities

What is ready, what is close, what remains · 23 September 2026

Summary. The sales side of USSCOS is built and working — quoting, orders, invoicing, customers, products, reps, artwork. The warehouse side is not: of the seven ways stock moves at USSC, one and a half are built. That gap is the whole distance between where this is now and something the business can run on.

Accounting is not on the critical path. QuickBooks keeps the books, bills stay in QuickBooks, and none of it blocks going live.

Ready to use now

Built, deployed and tested against real data.

Area	What it does
Leads and pipeline	Web forms feed leads, routed by type, converted to customers
Quotes	Built, emailed, converted to orders; status flows back to the lead
Sales orders	Created, edited, packing slips, payment collection
Invoicing	Ship and invoice, receipt or invoice email, closes the order
Customers	41,233 records, 360° profile, revenue history, activity timeline, alerts
Duplicate prevention	Adding a customer warns on likely duplicates, including ones the user cannot see
Products	891 records, images, documents, ~100 fields for EDI and Amazon
Sales reps	33 reps, credited revenue, commission rates, logins
Reporting	Sales by rep, sales by employee, A/R aging, all with date ranges
Pick and verify	Scan against the order, refuse wrong items, report short stock
Artwork binder	Proofs with full revision history and who approved which version
Access control	Reps and distributors restricted to their own customers, enforced in the data layer
Admin	Users, reps, terms, carriers, tax rates, with safe deactivate and delete
Backups	Nightly, verified by restoring, copied off-site to DigitalOcean

Close to finished

Item	What remains	Effort
Stock locations	Tables built and both warehouses created. Needs the screens, plus bays and racks for 730	Small
Job binder	Artwork done. Production notes, QA checklist and photos follow the same pattern	Medium
Shipping queue	Working. Needs pack verification and the link through to carriers	Medium
Dashboard	Every figure is a placeholder showing zero. The data exists; nothing is wired to it	Small

Left to build

Grouped by what they belong to. Effort is relative, not a quote.

Inventory — the critical path

Item	Why it matters	Effort
Receiving	How stock first enters the system. Nothing works without it	Medium
Deduct stock on shipment	Shipping currently does not move inventory at all	Small
Transfers between warehouses	Scan out, in transit, scan in — needed for 730	Medium
Returns	Named as a main cause of drift. Nothing exists	Medium
Adjustments and write-offs	The honest correction path. Without it people work around the system	Small
Cycle counting	Rolling counts so errors surface in days, not at year end	Medium
Opening physical count	One full count, entered once the screens above exist	Operations

Shipping and carriers

Item	Why it matters	Effort
Pack verification	Second scan at the bench catches what picking missed	Small
Customer PO on the order	Replaces comparing addresses against printed paperwork	Small
Freight section and BOL	Carrier, cost, pallets and a generated bill of lading	Medium
FedEx	Labels and tracking captured rather than typed	Medium
Kuebix quotes	Removes retyping. Pending confirmation the API is enabled	Medium

Data and integration

Item	Why it matters	Effort
Product reimport	765 SKUs with barcodes and pack quantities replacing the current 891	Small
QuickBooks bridge	Reads QuickBooks and talks to USSCOS. Outbound only — no port to open	Large
Capture QuickBooks IDs	So a rename in QuickBooks never breaks the link again	Small
Two-entity support	TCC and USSC, with per-area access rather than one flag	Large

Later — genuinely optional for go-live

Customer and distributor portals with reordering · tiered and volume pricing · rep dashboard and commission statements · public website · two-factor authentication and audit log · Mar-Kov integration · accounting ledger, if it is ever wanted.

Waiting on other people

Not stalled for want of effort — listed so they are not mistaken for work in progress.

Item	Waiting on
Final product file	Units per case, pallet quantity, barcodes, QuickBooks IDs
SKU renaming	Being finalised in QuickBooks
Kuebix automation	Confirmation the API is enabled on the subscription, and its cost
FedEx	Account number and API credentials
Operations walkthrough	The interview, which settles who owns stock at the canning company
Inventory valuation	The accountant. Blocks costing stock, not counting it
Invoice fields (terms, ship via, PO)	A QuickBooks export carrying those columns
Distributor list	Turf Tank, BSN and the others

The order I would build it in

The principle. Every way stock moves needs a screen, and each screen must be quicker than not using it. Any movement without one becomes the place where someone shrugs and the count starts rotting again — which is exactly how the current numbers went wrong.

	Phase	Contains	Ends with
1	Stock can move	Receiving · deduct on shipment · transfers · adjustments	Every movement has a screen
2	Stock is right	Returns · cycle counting · opening physical count	A count people believe
3	Product data	Reimport 765 SKUs with barcodes, pack quantities, QuickBooks IDs	Scanning works on real products
4	Shipping finished	Pack verification · customer PO on the order · freight and BOL	Orders leave verified
5	Carriers	FedEx labels and tracking · Kuebix quotes	No retyping
6	QuickBooks	The bridge, both files, items and customers pulled	Renames stop breaking things
7	Two entities	TCC and USSC with per-area access	TCC staff can use it
8	The rest	Dashboard · job binder · portals · tiered pricing	—

Phases 1 to 4 are what "functional" means. Five onwards make it faster and wider, but the warehouse can run without them.

One sequencing point worth protecting. The physical count belongs in phase 2, *after* the movement screens exist. Counting first means the count is out of date before anyone can use it, and the second count is much harder to ask for than the first.

Questions that need answers

Grouped by who can answer them. The starred ones change what gets built.

Operations

- ★ **Does a pallet count as a quantity of cases, or as its own item?** This decides how counting works across pack levels, and the product file cannot be finished without it.
- ★ **While paint sits at the canning company, is it ours or TCC's?** Decides whose inventory it is.
- How much paint is lost turning totes into cans? Nobody tracks it, but someone knows.
- What bays and racks exist in 730, and how are they labelled?
- Is the draft-to-confirmed step happening on every order, or are some invisible to shipping?
- When is stock considered gone — at pick, at load, or at invoice?
- Who prints labels, and on what printer?

Bookkeeper and accountant

- ★ **Who owns inventory valuation — USSCOS or QuickBooks?** Blocks costing stock, though not counting it.
- After the rename, do historical invoices show the new item names in an export?
- Can the export include the QuickBooks ListID column?
- How is sales tax set up — one rate per state, or county codes?
- Are processor fees captured per transaction or reconciled monthly?

Suppliers and vendors

- ★ **Kuebix: is API access enabled on our subscription, and does it cost extra?**
- FedEx: account number and API credentials.
- Mar-Kov: is there an API, and is its QuickBooks link switched on today?

Management

- ★ **Will TCC staff use USSCOS at go-live?** Two-entity support is far cheaper to add during the data reimport than afterwards.
- Does anyone need a combined TCC and USSC view? Neither QuickBooks file sees the other, so only USSCOS could produce one.
- Who is the pilot group for the scanners, and when can they spend a day on it?

The single most useful thing right now is the finished product file — units per case, pallet quantity, barcodes and QuickBooks IDs. Receiving, transfers, counting and scanning all wait on it, and no amount of building substitutes for it.
